Recruitment Consulting Application Blueprint

A Complete Step-by-Step Architecture Guide for Multi-Vendor Isolation and Candidate Tracking

1. Required Tools

You only need two free browser-based cloud tools to build this complete application without coding:

- **Airtable (airtable.com):** Serves as your backend database to store jobs, sub-vendors, candidates, tracking histories, timelines, and feedback logs.
- **Softr (softr.io):** Serves as your user interface. It handles logins, creates private portals for sub-vendors, and builds your master admin control panel.

2. Phase 1: Database Architecture Setup (Airtable)

Create a base named **Recruitment Tracker** and create three distinct tables with these exact columns:

Table 1: Jobs

Column Name	Field Type	Purpose
Job Title	Single line text	Primary column containing the position title.
Company Name	Single line text	Name of the client company.
Total Rounds	Number (Integer)	Total interview rounds planned (e.g., 3, 5).
Assigned Vendors	Link to 'Vendors'	Allows assigning jobs to specific sub-vendors.

Table 2: Vendors

Column Name	Field Type	Purpose
Vendor Name	Single line text	Primary column containing the agency's name.
Vendor Email	Email	Critical field used for system login authentication.
Assigned Jobs	Link from 'Jobs'	Automatically populates when linked from the Jobs table.

Table 3: Candidates

Column Name	Field Type	Purpose
Candidate Name	Single line text	Full name of the job seeker.
Resume	Attachment	File upload field for PDF or Word resumes.
Job Role	Link to 'Jobs'	Connects the candidate to a specific job vacancy.
Submitted By	Link to 'Vendors'	Connects the candidate to the sub-vendor who sourced them.
Submission Time	Created Time	Auto-stamps exact date and time on profile creation.
Status	Single Select	Options: Screening, Round 1, Round 2, Round 3, Round 4, Round 5, Selected, Rejected.
Feedback Notes	Long text	Saves specific text reasons why a profile passed or failed.
Reschedule?	Checkbox	Flag indicating if an interview needs to be reset.

3. Phase 2: Interface Configuration & Portal Setup (Softr)

Step 1: Link User Directory & Enforce Privacy

Navigate to the **Users** tab in Softr. Click *Change Source* and link it to your Airtable **Vendors** table. Map the application authentication email property directly to the **Vendor Email** column. This builds the security wall preventing external access.

Step 2: Create Sub-Vendor Pages

• **Jobs Dashboard:** Add a standard List Block displaying the *Jobs* table. Under the block settings, navigate to **Conditional Visibility / Filtering**. Apply the rule: Assigned Vendors contains Logged-in user's Account Email. This forces Vendor A to see only their assigned workloads.

• **Profile Submission Form:** Set up a List Details page connected to the Jobs block. Embed a Form block pointing to the *Candidates* table. Add visible inputs for Candidate Name and Resume. Crucially, add a **Hidden Field** mapped to *Job Role* with value set to Current Record ID, and a second **Hidden Field** mapped to *Submitted By* with value set to Logged-in user's email. This auto-tags submissions silently.

• **Tracking Dashboard:** Add a Grid or Table block pulling data from the *Candidates* table. Apply a strict **Conditional Filter**: Submitted By equals Logged-in user's Account Email. This protects proprietary data across sub-vendors while letting them monitor feedback.

Step 3: Create the Master Admin Page

Build a page named *Admin Panel*. In page visibility settings, restrict access solely to your personal email address. Add a Table List block pointing to the *Candidates* table with **no filters**. Under the actions tab, enable **Inline Editing** for the *Status*, *Feedback Notes*, and *Reschedule?* properties. When client feedback arrives, modify fields directly here; adjustments reflect on sub-vendor dashboards instantly.

4. Troubleshooting Common Integration Errors

Symptom	Root Cause Analysis	Immediate Fix Action
Softr displays: 'Field mapping missing or type mismatch'	A text input field from the Softr UI is attempting to save inside a relation/link row without standard reference indices.	Verify that the form's hidden field for Job Role passes the 'Current Record ID' instead of raw text properties.
A sub-vendor logs in to a completely blank dashboard screen	Casing variations exist between tables or the specific vacancy cell lacks assignments inside the database matrix.	Ensure the vendor email is typed completely in lowercase across all records and linked inside the Jobs table cells.
Timestamps do not trigger or output blank values	A standard text field was used to track submission times manually instead of system tracking loops.	Delete the custom column. Add a new column configured explicitly to the system-managed 'Created Time' data type.
